(54) Chip antenna having multiple resonance frequencies

(57) A chip antenna (10) comprising a substrate (11) comprising at least one material selected from dielectric materials and magnetic materials, at least two conductors (12a, 12b) formed on at least one surface of the substrate (11) or inside the substrate, and at least one feeding terminal (15) provided on the surface of the substrate (11) for applying a voltage to the conductors.

FIG. 1

EP 0 777 293 A1

Description

BRIEF DESCRIPTION OF THE DRAWINGSBACKGROUND OF THE INVENTION

1. Field of the Invention

The present invention relates to chip antennas and particularly a chip antenna used for mobile communication and local area networks (LAN).

2. Description of the Related Art

Conventional antennas include monopole antennas and chip antennas, for example.

Fig. 9 shows a typical prior art monopole antenna 1. The monopole antenna 1 has a conductor 2 perpendicular to an earth plate (not shown in the figure) in air (dielectric constant $\epsilon = 1$ and relative permeability $\mu = 1$), the one end 3 of the conductor 2 forming a feeding section and the other end 4 being a free end.

Fig. 10 is a side view of a typical prior art chip antenna 5. The chip antenna 5 comprises an insulator 6, a coil conductor 7, a magnetic member 8, and external connecting terminals 9a and 9b.

Each of the prior art monopole antenna and chip antenna set forth above has only one feeding section and conductor, and thus has only one resonance frequency. Thus, a plurality of monopole antennas or chip antennas are required for responding to two or more different resonance frequencies, and they are not applicable to uses, requiring compact antennas, such as mobile communication, for the reason of their sizes.

SUMMARY OF THE INVENTION

It is an object of the present invention to provide a compact chip antenna which can respond to a plurality of resonance frequencies, and thus can be used for mobile communication and the like.

In accordance with the present invention, a chip antenna comprises a substrate comprising at least one material selected from dielectric materials and magnetic materials, at least two conductors formed on at least one of a surface of the substrate and inside the substrate, and at least one feeding terminal provided on the surface of the substrate for applying a voltage to the conductors.

Preferably, the conductors connect with each other in series or in parallel.

Because the chip antenna in accordance with the present invention has a plurality of conductors, the single chip antenna can respond to a plurality of resonance frequencies.

Other features and advantages of the present invention will become apparent from the following description of the invention which refers to the accompanying drawings.

Fig. 1 is an isometric view illustrating a first embodiment of a chip antenna in accordance with the present invention;

Fig. 2 is a decomposed isometric view of the chip antenna in Fig. 1;

Fig. 3 is a graph illustrating reflection loss characteristics of the chip antenna in Fig. 1;

Fig. 4 is an isometric view illustrating a second embodiment of a chip antenna in accordance with the present invention;

Fig. 5 is a decomposed isometric view of the chip antenna in Fig. 4;

Fig. 6 is a graph illustrating reflection loss characteristics of the chip antenna in Fig. 4;

Fig. 7 is an isometric view illustrating a third embodiment of a chip antenna in accordance with the present invention;

Fig. 8 is a graph illustrating reflection loss characteristics of the chip antenna in Fig. 7;

Fig. 9 is a schematic view of a conventional monopole antenna; and

Fig. 10 is a side view of a conventional chip antenna.

DETAILED DESCRIPTION OF EMBODIMENTS OF THE INVENTION

Embodiments in accordance with the present invention will now be explained with reference to drawings.

Fig. 1 is an isometric view illustrating a first embodiment of a chip antenna in accordance with the present invention, and Fig. 2 is a decomposed isometric view of the chip antenna.

The chip antenna 10 comprises meander conductors 12a and 12b each having a plurality of corners in a rectangular parallelepiped substrate 11. The substrate 11 is formed by laminating rectangular dielectric sheet layers 13a through 13e each comprising a dielectric material (dielectric constant = ca. 6.1) mainly containing barium oxide, aluminum oxide and silica. Meander conductors 12a and 12b comprising copper or a copper alloy are provided on the surfaces of the sheet layers 13b and 13d by printing, evaporation, adhesion, or plating. A via hole 14 is provided at the one end of the conductor 12b on the sheet layer 13d and through the layer 13c. Two meander conductors 12a and 12b are formed inside the substrate 11 by laminating the sheet layers

13a through 13e, where the one end of the conductor 12a and the one end of the conductor 12b connect with each other through the via hole 14 inside the substrate 11.

The other end of the conductor 12a is drawn out to the surface of the substrate 11 to form a feeding section 16 which connects with a feeding terminal 15 formed on the surface of the substrate 11 for applying a voltage to the conductors 12a and 12b. The other end of the conductor 12b forms a free end 17 inside the substrate 11. In this case, the conductors 12a and 12b connect with each other through the via hole 14 in series to the feeding terminal 15.

Fig. 3 is a graph illustrating the reflection loss characteristics of the antenna 10. The antenna 10, in which the conductors 12a and 12b connect with each other in series, exhibits a resonance frequency corresponding to the conductor 12a at approximately 2.17 [GHz] (b1 in Fig. 3), a resonance frequency corresponding to the conductor 12b at approximately 2.27 [GHz] (c1 in Fig. 3), and a resonance frequency due to the coupling of the conductors 12a and 12b at approximately 1.56 [GHz] (a1 in Fig. 3). Accordingly, the antenna in the embodiment set forth above can respond to three different resonance frequencies, i.e., 1.56 [GHz], 2.17 [GHz], and 2.27 [GHz].

Fig. 4 and Fig. 5 are an isometric view and a decomposed isometric view, respectively, illustrating a second embodiment of a chip antenna in accordance with the present invention.

The chip antenna 20 is provided with two conductors 22a and 22b spirally coiled inside a rectangular parallelepiped substrate 21 in the longitudinal direction of the substrate 21. The substrate 21 comprises rectangular sheet layers 23a through 23e comprising a dielectric material, e.g., having a dielectric constant = ca. 6.1 and mainly containing barium oxide, aluminum oxide and silica. The sheet layers 23a through 23d are provided with L-shape or linear conductive patterns 24a through 24h and 25a through 25h each comprising, e.g., copper or a copper alloy on the surfaces of their respective sheet layers, by printing, evaporation, adhesion and plating. Further, via holes 26a are provided at both ends of the conductors 24e through 24g and 25e through 25g and at the one end (26b) of the conductors 24h, 25a and 25h on the sheet layer 23b through 23d along the vertical direction. When the sheet layers 23a through 23e are stacked and the conductive patterns 24a through 24h and 25a through 25h connect with each other through via holes 26, spirally coiled conductors 22a and 22b each having a rectangular cross-section are formed. The one end of the conductor 22a and the one end of the conductor 22b connect with each other through a via hole 26b.

Further, the one of the ends of conductors 22a and 22b (one of the ends of conductive patterns 24a and 25a) are drawn out at the surface of the substrate 21 to form a feeding section 27 which connects with the feeding terminal 15 on the surface of the substrate 21. The

other ends of the conductors 22a and 22b (the other ends of conductive patterns 24h and 25h) form free ends 28a and 28b, respectively, inside the substrate 21. In this case, the conductors 22a and 22b connect with each other in parallel to the feeding terminal 15 through the via hole 26b.

Fig. 6 is a graph illustrating reflectance loss characteristics of the antenna 20. Fig. 6 demonstrates that a resonance frequency for the conductor 22a appears near 1.50 [GHz] (a2 in the figure), a resonance frequency for the conductor 22b appears near 2.09 [GHz] (b2 in the figure), and a resonance frequency due to coupling of the conductors 22a and 22b appears near 2.66 [GHz] (c2 in the figure).

As set forth above, this antenna can respond to three different resonance frequencies, i.e., 1.50 [GHz], 2.09 [GHz], and 2.66 [GHz].

Fig. 7 is an isometric view of a third embodiment of the chip antenna in accordance with the present invention.

The chip antenna 30 comprises a rectangular parallelepiped substrate 31 comprising a dielectric material, for example, having a dielectric constant: ca. 6.1 and mainly containing barium oxide, aluminum oxide and silica; conductors 32a and 32b which comprise, e.g., copper or a copper alloy, and is spirally coiled inside the substrate 31 along the longitudinal direction; and feeding terminals 33a and 33b provided at the side, top face and bottom face for applying a voltage to the conductors 32a and 32b. The one ends of the conductors 32a and 32b form feeding sections 34a and 34b which connect with feeding terminals 33a and 33b, respectively. The other ends of the conductors 32a and 32b form free ends 35a and 35 inside the substrate 31. In this case, the conductors 32a and 32b are independently formed inside the substrate 31.

Fig. 8 is a graph illustrating reflectance loss characteristics of the antenna 30 comprising the conductors 32a and 32b formed independently. Fig. 8 demonstrates that a resonance frequency for the conductor 32a appears near 0.85 [GHz] (a3 in the figure), a resonance frequency for the conductor 32b appears near 1.50 [GHz] (b3 in the figure), and a resonance frequency corresponding to the second harmonic of the conductor 32a appears near 1.55 [GHz] (c3 in the figure).

As set forth above, the antenna in the third embodiment can respond to two different resonance frequencies at 0.85 [GHz], and 1.50 [GHz]. Further, the bandwidth near 1.50 [GHz] can be expanded by the second harmonic.

In this case, when the conductors 32a and 32b are provided so that the coiling axis of the conductor 32a is perpendicular to that of the conductor 32b, coupling between two conductors can be suppressed, and thus the resonance frequency can be readily controlled.

In the first through third embodiments set forth above, although the substrate of each chip antenna comprises a dielectric material mainly containing barium oxide, aluminum oxide and silica, other dielectric

materials mainly containing titanium oxide and/or neodymium oxide, magnetic materials mainly containing nickel, cobalt, and/or iron, and combinations of dielectric materials and magnetic materials also can be used as the substrate.

Although each antenna has two conductors in the embodiments set forth above, the antenna can have three or more conductors for providing more resonance frequencies. For example, the antenna having three conductors can respond to four different resonance frequencies.

The conductors can be provided on at least one side of the surface of the substrate and inside the substrate, other than inside of the substrate as set forth in each embodiment.

Although the conductor is meanderingly formed in the first embodiment, the conductor can be spirally coiled. In contrast, the conductors in the second and third embodiments which are spirally coiled, can also be meanderingly formed.

In the second and third embodiments, the conductors can be spirally coiled in the vertical direction of the substrate, as well as in the longitudinal direction.

Further, the feeding terminal can be provided at any appropriate position of the substrate, and is not limited to the positions shown.

Since the chip antenna in accordance with the present invention having a plurality of conductors can respond to a plurality of resonance frequencies, a multi-band antenna system can be achieved. Further, the band width can be expanded by adjoining a plurality of resonance frequencies to each other.

Although the present invention has been described in relation to particular embodiments thereof, many other variations and modifications and other uses will become apparent to those skilled in the art. Therefore, the present invention should be limited not by the specific disclosure herein, but only by the appended claims.

Claims

1. A chip antenna (10; 20; 30), comprising:

a substrate (11; 21; 31) comprising at least one of a dielectric material and a magnetic material;

a first conductor (12a; 22a; 32a) disposed on at least one of a surface of said substrate (11; 21; 31) and inside said substrate;

a second conductor (12b; 22b; 32b) disposed on at least one of a surface of said substrate (11; 21; 31) and inside said substrate; and

at least one feeding terminal (15, 33a; 33b) provided on the surface of said substrate (11; 21; 31) for applying a voltage to at least one of said conductors.

2. A chip antenna (10) according to claim 1, wherein said first and second conductors (12a, 12b) connect with each other in series.
3. A chip antenna (20) according to claim 1, wherein said first and second conductors (22a, 22b) connect with each other in parallel.
4. A chip antenna (20; 30) according to one of claims 1 to 3, wherein said first conductor (22a; 32a) comprises a spiral.
5. A chip antenna (20; 30) according to one of claims 1 to 4, wherein said second conductor (22b; 32b) comprises a spiral.
6. A chip antenna (10) according to one of claims 1 to 3, wherein said first conductor (12a) is meanderingly formed.
7. A chip antenna (10) according to one of claims 1 to 3, wherein said second conductor (12b) is meanderingly formed.
8. A chip antenna (10; 20; 30) according to one of claims 1 to 7, wherein said chip antenna further comprises at least one fixing terminal to fix said substrate to a mounting board.
9. A chip antenna (30) according to claim 1, wherein a first feeding terminal (33a) is provided on the surface of said substrate (31) for applying a voltage to said first conductor (32a), and a second feeding terminal (33b) is provided on the surface of said substrate (31) for applying a voltage to said second conductor (32b).
10. A chip antenna (10; 20; 30) according to claim 1, wherein the substrate comprises a plurality of layers (13a-13e; 23a-23e).
11. A chip antenna (10) according to claim 10, wherein the first conductor (12a) is disposed on a surface of a first layer (13d) and the second conductor (12b) is disposed on a surface of a second layer (13b), said layers being laminated together.
12. A chip antenna (10) according to claim 11, wherein the first and second conductors (12a, 12b) are coupled together by a conductive through hole (14) disposed through at least one of the layers.
13. A chip antenna (20) according to claim 10 wherein portions of said first conductor (22a) are disposed on at least two layers, portions of said second conductor (22b) are disposed on at least two layers, a conductive through hole being provided in at least one of said layers connecting respective portions of the first conductor (22a) together when the layers

- are laminated together and a conductive through hole being provided in at least one of said layers connecting respective portions of the second conductor (22b) together when the layers are laminated together.
14. A chip antenna (10; 20; 30) according to one of claims 1 to 13, wherein said chip antenna has a plurality of resonance frequencies due to said two conductors.
15. A chip antenna (30) according to claim 1, wherein the first and second conductor (32a, 32b) each have a feeding terminal (33a, 33b).
16. A chip antenna (10; 20; 30) according to one of claims 1 to 15, wherein at least one of said conductors (12b; 22a, 22b; 32a, 32b) has a free end (17; 28a, 28b; 35a, 35b).
17. A chip antenna (20; 30) according to claim 1, wherein both said conductors (22a, 22b; 32a, 32b) have a free end (28a, 28b; 35a, 35b).
18. A chip antenna (10, 20, 30) according to one of claims 1 to 17, wherein the conductors (12a, 12b; 22a, 22b; 32a, 32b) comprise copper or a copper alloy.
19. A chip antenna (10, 20, 30) according to one of claims 1 to 18, wherein the substrate (11; 21; 31) comprises a combination of a dielectric and a magnetic material.
20. A chip antenna (10; 20; 30) according to one of claims 1 to 19, wherein the dielectric material comprises barium oxide, aluminum oxide and silica.
21. A chip antenna (10; 20; 30) according to one of claims 1 to 19, wherein the dielectric material comprises at least one of titanium oxide and neodymium oxide.
22. A chip antenna (10; 20; 30) according to one of claims 1 to 21, wherein the magnetic material comprises at least one of nickel, cobalt and iron.
23. A chip antenna (20; 30) according to claim 1, wherein the chip antenna has three resonance frequencies.
24. A chip antenna according to claim 1, wherein the substrate is mounted on a board extending in a first direction, the conductors being arranged to have a longitudinal extent in the first direction.
25. A chip antenna according to claim 1, wherein the substrate is mounted on a board extending in a first direction, the conductors being arranged to have a longitudinal extent in a second direction substantially perpendicular to the first direction.
26. A chip antenna according to claim 23, wherein at least two of the resonance frequencies are spaced close together so that an area of extended bandwidth can be achieved near the two resonance frequencies.
27. A chip antenna (10; 20; 30) according to one of claims 1 to 26, wherein the substrate comprises a rectangular parallelepiped.
28. A chip antenna (20; 30) according to claim 4 or 5, wherein said spiral conductor has a rectangular cross section.
29. A chip antenna according to claim 5, wherein said spiral conductor has a rectangular cross-section.
30. A chip antenna (10; 20; 30) comprising:
- a substrate (11; 21; 31) comprising at least one of a dielectric material and a magnetic material;
 - a plurality of conductors (12a, 12b, 22a; 22b, 32a; 32b) disposed on at least one of a surface of the substrate (11; 21; 31) and inside the substrate;
 - at least one feeding terminal (15; 33a, 33b) provided on the surface of the substrate for applying a voltage to at least one of the conductors; and
 - said plurality of conductors (12a, 12b; 22a, 22b; 32a, 32b) providing said antenna with a plurality of resonance frequencies.
